Following the insight provided to us by the first few week's assignments, we have chosen to stick with our original language, Java 8. The language provides plenty of mature tools for developing a project with the language, such as:

- The package manager maven, which is easy to use and platform-independent
- Available and user-friendly libraries for JSON parsing, GUI, and Network connectivity
- A decent module system to structure and organize the project
- A Sufficient type system for our purposes so far

A few potential drawbacks to using the language:

- Grammar might be a little too verbose(also because the delivery system doesn't have more updated java)
- Effective solutions sometimes take a bit longer to implement than in other languages, like handling errors
